BASIC-ABSTRACT:

Polymer dyes and pigments are made by coupling diazonium compounds with addition polymers which contain coupling groups.

The use of polymer coupling agents permits a full colour range of polymer dyes to be produced by the selection of appropriate diazo compounds. The chemical and physical properties of the dyes can be adjusted to suit their end uses, which include dyeing natural and synthetic textiles, spin-dyeing acrylic fibres, and dyeing and colouring rubber, polymethyl methacrylate costing syrups, paper, leather, oil and water paints, ballpoint pen, felt pen and printing inks, laminates, soap and detergent.

Introducing a polymerisable group into a coupling agent which is an aryl compound substd. by an OH, (R = Me, Et, NH₂CO-, CH₂COO- or C₆H₅CONH-) or CH₃COCH₂CONH- group, copolymerising the product with an ethylenic monomer to produce a copolymer which may contain self-crosslinking (methylol) groups, and coupling the copolymer with a diazonium compound.
